

Using function tables (Tutorial B2)

http://www.atomiclearning.com/k12/en/movie/86404/play_window?type=Tutorial&sid=2421

[00:00:00.00]

You can evaluate graphed functions in a table using the Function Table feature. First, let's graph a couple of

[00:00:06.00]

functions. I'll insert the Graphs application into a new page by clicking Insert, and then choosing Graphs. For

[00:00:15.00]

my first function, in the entry line at the bottom of the work area, I'll type "x" and then press Enter to graph

[00:00:21.00]

the function "f1(x)=x." I'll press Tab to reveal the Entry Line. Notice the entry line changes to allow me to graph

[00:00:30.00]

a second function, so I'll graph the expression "x^2+6, by typing "x," then "Shift-6," followed by "2," then the

[00:00:39.00]

right arrow key to move out of the exponent, followed by "+6", and then I'll press Enter to plot the function. Now

[00:00:49.00]

I'll create a Function Table based on these functions by clicking Table in the Document Tools, and choosing Split-

[00:00:56.00]

screen Table. This will bring up a split screen view, with my original application on the left, and my Function Table

[00:01:02.00]

on the right. By default, the expressions are evaluated when x starts at 0, and moves in single integer steps up

[00:01:10.00]

and down. I can move up and down in the list by pressing the up and down arrows on the keyboard. I can see that

[00:01:18.00]

each of my functions are in their respective columns, so the first column shows me values for the expression

[00:01:23.00]

$f_1(x) = x$," and the second column shows values for the expression $f_2(x) = x^2 + 6$." I'll move back to the Graphs application

[00:01:32.00]

by clicking on it, and then I'll move my pointer to the line created by the first function. When the line is highlighted,

[00:01:40.00]

I'll click and drag to move the line around the graph. Notice that the function changes, the values in the Function Table

[00:01:47.00]

change as well. I can also redefine the function in the table. I'll double-click in the cell of the function table

[00:01:55.00]

that currently says " $x^2 + 6$," and I'll change the "+" to a "-" so that the equation is " $x^2 - 6$." Now, I'll press

[00:02:05.00]

Enter, and the graph and data change immediately. If I want to change the preferences for the Function Table, I

[00:02:13.00]

can click on Table in the Document Tools and choose "Edit Table Settings." Here, I can choose the starting value

[00:02:20.00]

for the table as well as the steps between each number, so if I want the first value to be 5, and then the steps

[00:02:27.00]

to go up or down by three, I can type "5" in the Table Start field, and then "3" in the Table Step field, and

[00:02:35.00]

then click OK. Notice my first value is now 5, the second is 8, and so on. I'll open the preferences again by clicking

TI-Nspire™ Software Script

[00:02:44.00]

Table and choosing “Edit Table Settings,” again, and this time I’m going to do something different. I want the table

[00:02:52.00]

to wait for me to enter a value for the independent variable x ” before evaluating it. To do this, just click the drop-

[00:02:59.00]

down menu for Independent, and then select the Ask option. Then I’ll click OK. Now, I can type a value for x and press

[00:03:09.00]

Enter, and the Function table will evaluate it.

[00:03:14.00]
